II. LOAD CAPACITY TABLES

1. Explanations

- 1.1 The load capacity values in the tables are stated in metric tons [t].
- 1.2 The working radius is the horizontal gravity center distance of the load from the rotational axis of the crane superstructure measured at the ground. The radius stated is valid under load conditions, i.e. including boom flexure.
- 1.3 Boom positions differing from those given in the load capacity tables are not permissible.
- 1.4 Even without a load, the boom may only be moved inside those areas for which load capacity values are stated, otherwise there is a danger of tilting. In normal operation, this hazard is prevented by the overload safety device. After switching to "Assembly" mode (with the "assembly" key-operated switch), the boom must not be lowered or topped outside the range of the working radius.
- 1.5 The stated load capacities contain the weights of the load bearing, lifting and slinging tackle. The possible weight for the load to be lifted is therefore reduced according to the weights of the afore-mentioned tackle.
- 1.6 If the boomnose is mounted on the jib head during crane operation, then the possible load is reduced further corresponding the weight of the boomnose (0,128 t).

2. Crane operating mode "Crane supported"

- 2.1 Before the crane is raised on its supports, the axle suspension must be blocked.
- 2.2 The sliding arms of the hydraulic support jack must be extended (to a uniform length on both sides) to the extent stated in the applirope load capacity table.
- 2.3 The sliding arms must be secured by pins.
- 2.4 It is necessary to place stable underlay material under the support pads of the support jacks over a large surface area according to ground conditions.
- 2.5 All wheels must be raised clear of the ground.
- 2.6 The crane is to be horizontally aligned via the support control unit. Additionally, the horizontal position of the crane must be checked from time to time during crane operation and adjusted as required.

3. There is a danger of tipping or a risk of overloading load-bearing components if:

- 3.1 the slewing platform of an upright crane is turned away from the forward driving direction of the vehicle. Before turning the superstructure, the crane must be supported.
- 3.2 the four hydraulic supports of the crane are not properly supported and in vertical position.
- 3.3 the sliding rods are not slid out to the exact measurement specified in the load capacity charts (on both sides).
- 3.4 the sliding rods are not secured with pins.
- 3.5 the support pads are not supported with the appropriate base material (surface area too small) for the soil conditions.
- 3.6 the loads and / or the working radi in the load capacity charts corresponding to the jib length are exceeded or not met.
- 3.7 cranes are operated too close to landfills, basements and slopes.
- 3.8 the hook load begins swinging due to improper handling.
- 3.9 pulling at an angle is executed. Pulling at an angle is most dangerous when it goes against the jib length direction. Pulling at an angle is not allowed.

4. Telescopic boom

- 4.1 The lifting capacity of the telescopic boom with its 5 extendable telescopic sections is limited. The loads stated in the load capacity tables must not be exceeded.
- 4.2 The specifications for the telescopic sections to be extended according to load and required boom length must be observed under all circumstances.
- 4.3 As a general rule, the boom should first be extended to the required length, and then loaded. However, it is possible to extend and retract the boom under partial load. The weight of this partial load is dependent on bearing pad lubrication and the available useable lengths of the telescopic sections.
- 4.4 Even without a load, the telescopic boom may only be moved within the working radius ranges for which values are listed in the load capacity table.

5. Rope winches

5.1 Winch 1

Winch 1 is designed for a maximum rope tension of 105 kN. This rope tension must not be exceeded under any circumstances. Accordingly, the minimum number of hoisting rope lines (rope reeving) should be selected according to the weight of the load to be lifted (see Table "Hoisting rope reeving" in Chapter II).

5.2 Winch 2

Winch 2 is designed for a maximum rope tension of 105 kN. This rope tension must not be exceeded under any circumstances. Accordingly, the minimum number of hoisting rope lines (rope reeving) should be selected according to the weight of the load to be lifted (see Table "Hoisting rope reeving" in Chapter II).

5.3 Prevention of rope slack formation:

5.3.1 When retracting the telescopic boom, the winch must be operated in the direction of lifting simultaneously, in order to prevent the hook block from descending to the ground and creating rope slack. The speed of the hoisting rope movement should be matched to that used for retraction!

5.3.2 The rope guides on the winches must be supervised by a member of the workforce when additional equipment is being mounted!

6. Hoisting rope reeving

6.1 The hoisting rope must be reeved in between boom head and hook block in accordance with the maximum rope tension of the winch and the weight of the load to be lifted.

6.2 If several hoisting rope lines are reeved in, the efficiency of the hook block is reduced due to pulley friction and rope flexure.
In consequence, with a rope tension of e.g. 105 kN, only 986 kN (99.2 t) can be pulled with a 10-fold line reeving, instead of 1050 kN (106.0 t).

6.3 Consult the table "Hoisting rope reeving" in Chapter II of this manual for the maximum loads in dependence on the number of hoisting rope lines.

6.4 The number of hoisting rope lines reeved must be set on the control and display unit of the LICCON overload safety device according to the current hoisting rope reeving total.

6.5 If the block hook is operated with a higher reeve number than necessary for the respective boom length loads, then the block hook weight will not be sufficient and can slacken the cable when lowering, which can lead to damage to the cable.

7. Changing between material handling and installation operation

7.1 Load carrying capacity of the crane

The load carrying members of the crane have been designed according to the load criteria for installation /set up operations (load collective classification = "light" = Q1 or L1). Stress collective S1 according to DIN 15018 Part 3 and stress margin range N1 according to DIN 15018 Part 1 or ISO 4301, group A1.

If an installation / set up crane is used material handling, the stress margin range increases. Therefore the loads must be reduced since a higher stress group now be applicable. This is especially true if the calculated loads are limited by strength values.

CAUTION: For crane value calculation, it has been assumed that the crane will be utilized as an installation crane (load collective classification = "light" = Q1 or L1). If the crane is also used in material handling application, premature wear of all drive sections must be expected, and cracks may occur in load carrying steel members. We therefore strongly recommend, that if the crane is utilized in material handling application, the load values are reduced by 50 %, as compared to the data given in the corresponding load carrying capacity chart.

For details, have material handling data ready and then contact your Liebherr Service Dept.

The size of the cables as well as drive sections of hoist gears are configured according to the load collectives applicable for installation operation (load collective classification = "light" = Q1 or L1):

ISO 4301/2 or 4308/2
Group A1
Hoist gears M3
Intake gears M2

If an installation / set up crane is used material handling (load collective classification = "light" = Q1 or L1), the stress margin range increases, the rope runs must therefore be reduced. If this is not assured, then the hoist rope wear out rate will be reached much earlier, and / or the hoist gear must be rebuilt / serviced much earlier.

Please refer to the information regarding wear out criteria for ropes according to DIN 15020, part 2 or ISO 4309 in chapter 8.01 "Repeat crane inspections" in the crane's Operating Instructions.

COMMENT: In order to keep wear out rate of hoist ropes as low as possible during material handling operation (load collective classification = "medium" or higher), we recommend the use of a special length rope, so that during material handling operation the rope is rolled onto drum of the hoist winch in only one rope layer. If several layers are on the rope drum, the wear rate increases. In addition, the winch drive will run cooler, if the crane is operated with only one rope layer.

8. LICCON Overload safety device and Limit switch

If the permissible load moment is exceeded, the electronic LICCON overload safety device shuts down the hoisting and boom topping movements. It is possible to decrease the load by means of movements in the opposite direction. The LICCON overload safety device must be checked for correct operation on each occasion before operating the crane.

- 8.1 The LICCON overload safety device must be set to the current equipment mode of the crane by means of function keys or by entering the corresponding 4-digit code.
- 8.2 The LICCON overload limit switch is a safety device and must not be used as a shutdown device for operating purposes. The crane operator must assure himself of the weight of a load before attempting to lift it. The fact that the crane is equipped with the LICCON overload safety device does not free the operator from responsibility with regard to operating safety.
- 8.3 The control and display unit of the LICCON overload safety device indicates among other things the working radius, boom length, pulley height, load and degree of crane load utilization. This provides the operator with a constant overview of the working range and crane utilization.
- 8.4 The end of stroke switch fastened to the jib heads (lattice boom jib, auxilliary jib) should prevent the hook block from running into the jib head. The hoisting limit switches must be checked for correct operation on each occasion before the crane is operated.
- 8.5 Gear cam limit switches on the cable winches ensure that 3 safety turns remain on the rope drums. When the final cable layer is reached, a visual check is also necessary to ensure that the 3 safety turns are available. If the hoisting gears have been overturned in the lifting direction, or if the hoisting cable has been changed, then the corresponding limit switch must be reset before resuming operation.
- 8.6 The crane operator must check correct operation of the LICCON overload safety device on each occasion before operating the crane. The crane manufacturer will accept no liability for damage to the crane and consequential damage resulting from non-function or disactivation of the LICCON overload safety device.

9. Hook blocks and load hooks

9.1 Load capacity, rope pulleys and operating weight

| Load [t] | Number of rope pulleys | Strings | Weight [t] | Dead weight with mounted additional weight [t] |
|----------|------------------------|---------|------------|--|
| 183.3 | 12 | 20 | 3.400 | - |
| 176.0 | 9 | 19 | 2.000 | - |
| 135.0 | 7 | 14 | 1.500 | - |
| 108.3 | 5 | 11 | 1.450 | 1.960 |
| 108.3 | 5 | 11 | 1.300 | 2.000 |
| 71.0 | 3 | 7 | 1.040 | 1.365 |
| 31.3 | 1 | 3 | 0.870 | 1.125 |
| 31.3 | 1 | 3 | 0.840 | 1.125 |
| 10.6 | - | 1 | 0.500 | - |

CAUTION: Damage to ropes due to insufficient weight of the load hook!

If the hook block features insufficient weight to attain sufficient tension in the hoist rope, winding problems could occur at the winches as a result of the formation of slack rope during lifting and lowering of the hook block. This may in turn cause damage to the ropes!

! To avoid these winding problems at the winches, the weight of the hook block can be increased using additional weights or conversion kits wherever required. It should be noted here that the additional weights must be removed again if problems arise during the assembly and set-up conditions as a result of the increase in the dead weight!

9.2 Distance between hook and pulley set in the boom head

To determine the hook height, the hoist height must be reduced by the distance between the hook and the centre of the pulley set in the boom head.

The distances for the hook blocks being used can be obtained from the following table.

| Load [t] | Distance [H] | |
|----------|---|-----------------------------------|
| | at the pulley head from the telescopic boom [m] | at the pulley head of the tip [m] |
| 183.3 | 4.2 | - |
| 176.0 | 4.1 | - |
| 135.0 | 4.0 | - |
| 108.3 | 3.9 | - |
| 71.0 | 3.8 | 3,8 |
| 31.3 | 3.6 | 3,6 |
| 10.6 | 3.4 | 3,4 |

! The auxiliary device required for crane operation must be mounted on the crane in compliance with the manufacturer's instructions!

Working radius symbols

The working radius is the horizontal distance of the center of gravity of the load to the slewing axis of the crane superstructure as measured from the ground beneath the load.

Radius symbol for main boom operating modes.

Radius symbol for additional jib mode with folding jib.

Radius symbol for additional jib mode with fixed lattice fly jib.

Radius symbol for additional jib mode with luffing lattice fly jib.

Radius symbol for additional jib mode with hydraulically adjustable folding jib.

Telescopic boom length/units of measurement

In the row beneath this symbol the different boom lengths of the crane are indicated in columns. The letters next to the symbol indicate the units of measurement in the actual load chart, for example “ m > < t “ means that all lengths are given in meters [m] and all weights are given in metric tons [t].

CODE > 0001 <

Short code

4-digit short code; specifies in coded form the set operating mode / current set-up stage. The short code can be entered directly into the LICCON-over-load safety device to call up the respective load capacity table.

* n *

Hoisting rope reeving

Appears in the load charts as a line below the load capacity values. Indicates the number of hoisting rope reevings required to hoist the maximum load in the corresponding load chart column. If a load capacity value in the column exceeds the load which can be lifted with the maximum reeving, then an exclamation mark (!) is next to the reeving number to signify that special equipment is required to lift this load.

- Loads exceeding 135 t with auxiliary blocks only
- Loads exceeding 176 t with auxiliary device only

xx

Main Boom Angle

Only appears as line under the hoist cable reeving value during modes of operation with luffing fly jib. The columns contain the main boom angles, one after another, that must be set in order to be able to lift the load of the corresponding load column.

Extension conditions of the telescopic boom sections

Indications i percent for the individual telescopic sections (Tele 1 / Tele 2 / Tele 3 / Tele 4 / Tele 5).

Indication 0 = completely retracted, 100 = completely extended.

Extension conditions other than those specified in the load charts are prohibited.

A + symbol after a percentage entry means that the corresponding telescope parts are pinned down.

A - symbol after a percentage entry means that the corresponding telescopic section can be telescoped out under load to the extension condition value shown in percentages (according to the load capacity chart).

Counterweight

In this symbol, the size of the counterweight is indicated in metric tons [t] which must be on the crane superstructure in order to achieve the values of the given load chart.

Crane operations "Crane supported"

Indication of the support base (ex.: 8,85 m x 8,5 m = length x width). The hydraulic supports of the crane must be extended to the dimensions specified in this symbol and pinned when the corresponding load chart is being worked with.

Crane operation "Crane supported, asymmetric support base"

The hydraulic supports of the crane must be extended to the dimensions specified in this symbol and pinned when the corresponding load chart is being worked with.

With "Crane supported, asymmetric support base" crane operation, unlimited rotation is possible.

Example:

- 50% = Hydraulic support base, right-hand side of the crane 8,85 m x 5,59 m
- 100% = Hydraulic support base, left-hand side of the crane 8,85 m x 8,5 m

DANGER: Danger of tipping!

When the set support base no longer corresponds with the actual support base, it could cause the crane to topple.

!

The set support base must correspond with the actual support base and the travel direction (the crane symbol in the asymmetric support base is pointing downwards in the travel direction!).

Crane assembly "Crane supported at front, rear on tyres"

Specifications for support base (e.g. 10.0 m x _]_ m = Length x support base).

] = Special support base

- Working range to the rear
- Reduced support base front 5.59 m
- Support at rear on tyres: 16.00-25 (10 bar) or 20.50-25 (8 bar)
- without counterweight (0 t)

Slewing range

Slewing range data of the crane superstructure for the corresponding load capacity table:

- 360° = unlimited slewing permissible
- 0° = working range to the rear

Permissible wind speed

Indication of wind speed in [m/s] up to which crane operation is permissible depending on boom length. If the wind speed exceeds the indicated value, crane operations must be terminated, and if necessary, equipment must be removed from the crane.

13. Observation of wind conditions

13.1 Wind influence on the LICCON-overload safety device

When working in operation modes involving long boom systems and steeper boom positions in particular, the wind can either increase or ease additional duress on the crane system. The load will then be incorrectly displayed, and the LMB can shut down too early or too late.

13.1.1 Wind from the rear

With wind from the rear the boom system will be under increased duress. The load being displayed is too high. LMB-shutdown occurs with loads smaller than the max. load.

13.1.2 Wind from the front

With wind from the front the boom system will be eased of duress. The load being displayed is too low. LMB-shutdown will only occur with loads greater than the max. load.

DANGER: Risk of accident!

Wind from the front will not relieve duress from the hook, hoist cable, cable pulleys or the hoisting winch. These units can become overloaded through lifting to the point of LMB-shutdown with wind from the front!

The entire crane can become overloaded when wind from the front eases, if it has previously been loaded to the point of LMB-shutdown!

! The operator must therefore be aware of the load weight and may not then exceed the max. load!

13.2 Permissible wind speed and surface susceptibility to wind

13.2.1 Crane operation is permissible up to the wind velocity stated in the load capacity table corresponding to the current boom length.

DANGER: Risk of accident!

The crane operator must consult the local meteorological office for information on the expected wind velocity prior to commencing operations. If unacceptable wind velocities are forecast, it is not permissible to lift a load.

13.2.2 The wind surface A_{Wz} of the load must not exceed certain values. These values are stated in Diagram 1 (see next page).

If the wind surface of the load exceeds the diagram values, the wind velocity up to which crane operation is permissible is reduced correspondingly (note example below).

DANGER: Risk of accident!

Even if the wind surface of the load is smaller than the reference surface, it is prohibited to operate the crane if wind velocity exceeds the limits stated in the load capacity tables

13.2.3 Example:

- Weight of load according to load capacity chart: $m = 50,0 \text{ t}$
- Permissible wind velocity acc. to load capacity table: $v = 9,0 \text{ m/s}$
- Permiss. load wind surface acc. to Diag. 1: $A_{Wz} = 55,0 \text{ m}^2$
- Actual wind surface of load: $A_{Wr} = 100,0 \text{ m}^2$
- Diagram 2 yields for $v = 9 \text{ m/s}$ the impact pressure: $p = 50,0 \text{ N/m}^2$

Hence a load with the permissible wind surface $A_{Wz} = 55 \text{ m}^2$ is influenced by a force F :

$$F = \text{impact pressure } p \times \text{wind surface } A_{Wz} = 50 \text{ N/m}^2 \times 55 \text{ m}^2 = 2750 \text{ N}$$

For the actual wind surface $A_{Wr} = 100 \text{ m}^2$, a permissible impact pressure p results for the same force F :

$$p = \frac{F}{A_{Wr}} = \frac{2750 \text{ N}}{100 \text{ m}^2} = 27,5 \frac{\text{N}}{\text{m}^2}$$

For $p = 27,5 \text{ N/m}^2$, Diagram 2 yields a maximum permissible wind velocity of $v = 6,7 \text{ m/s}$.
